

Optimising Software Delivery with Value Streams

Joe Schmetzer • [@tumbarumba](#)

Introduction

Question One

What is it we do that's valuable?

A Value Stream

Types of Value Streams

Value Stream Tasks

Value add

Overhead

Queuing

A Value Stream in Detail

Value Stream Statistics

- 35 different activities
- 43 days lead time
- 7 days touch time

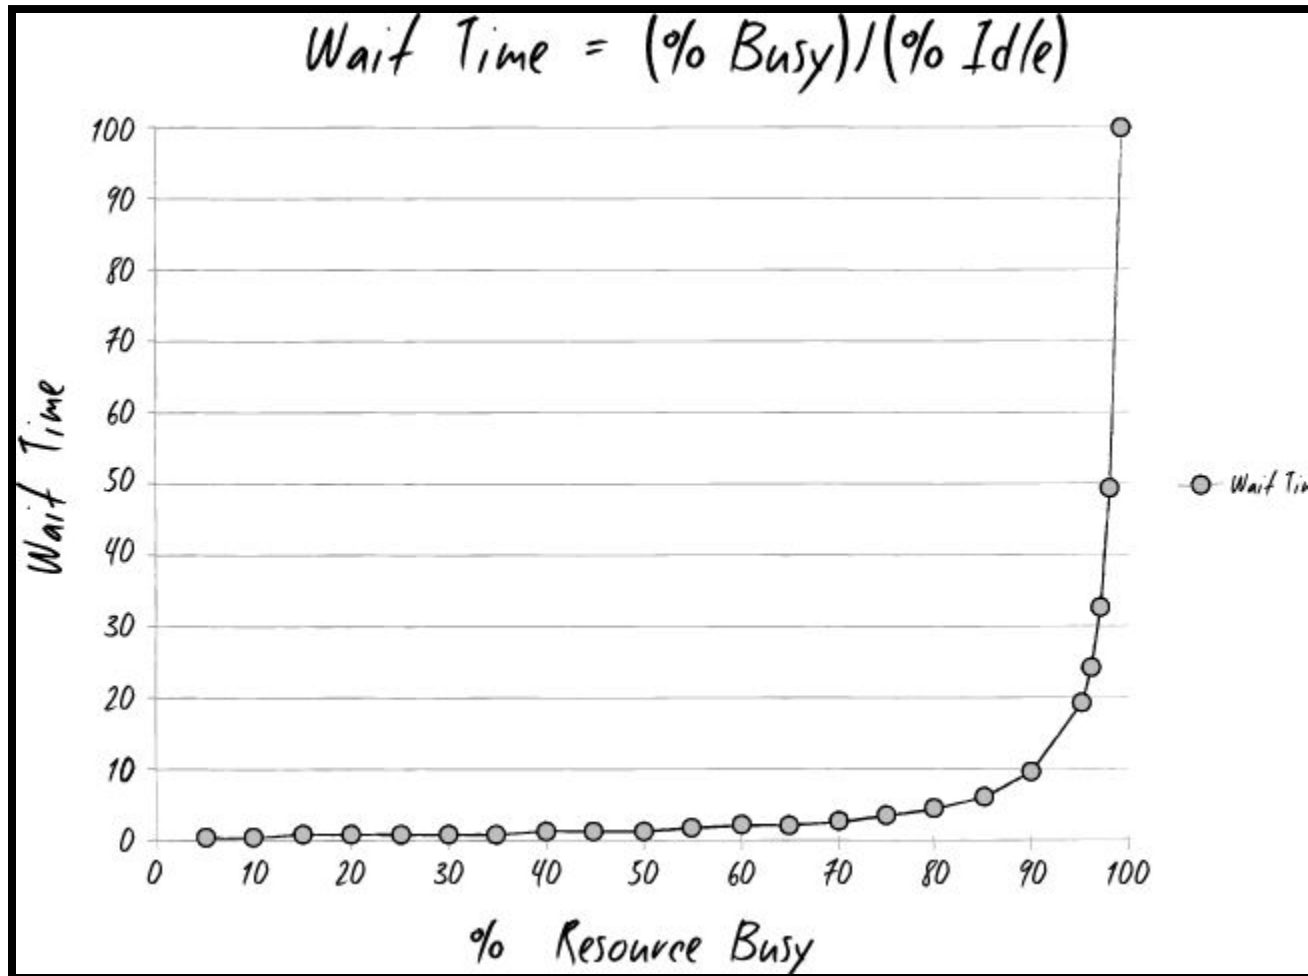

Question Two

Why does it take so long?

Single Task Analysis - Data

% Busy	Wait Time
0%	0
50%	1
75%	3
90%	9
95%	19
99%	99

Single Task Analysis - Graph

* Graph from the [The Phoenix Project](#), by Gene Kim, Kevin Behr and George Spafford

Little's Law

$$L = \lambda W$$

$$W = L/\lambda$$

Linked Queues

Question Three

What alternatives are there?

An Alternative Value Stream

Value Stream Statistics

- 13 different activities
- 5 days lead time
- 4 days touch time

Comparison of Value Streams

Resource Optimisation vs Flow Optimisation

- 43 days lead time
- 7 days touch time

- 5 days lead time
- 4 days touch time

Product Economic Framework

Standard economic measure:

Life-Cycle Profits

Cost of Delay

What happens to life-cycle profits if release is delayed 7 weeks?

Question Four

How do we change?

Culture

Don't ask for permission to do the right thing

Step 1: Measure

- Life-cycle profits delivered
- Lead time
- Size of backlog
- Work in progress
- Velocity
- ... whatever is relevant to you

Step 2: Visualise the current value stream

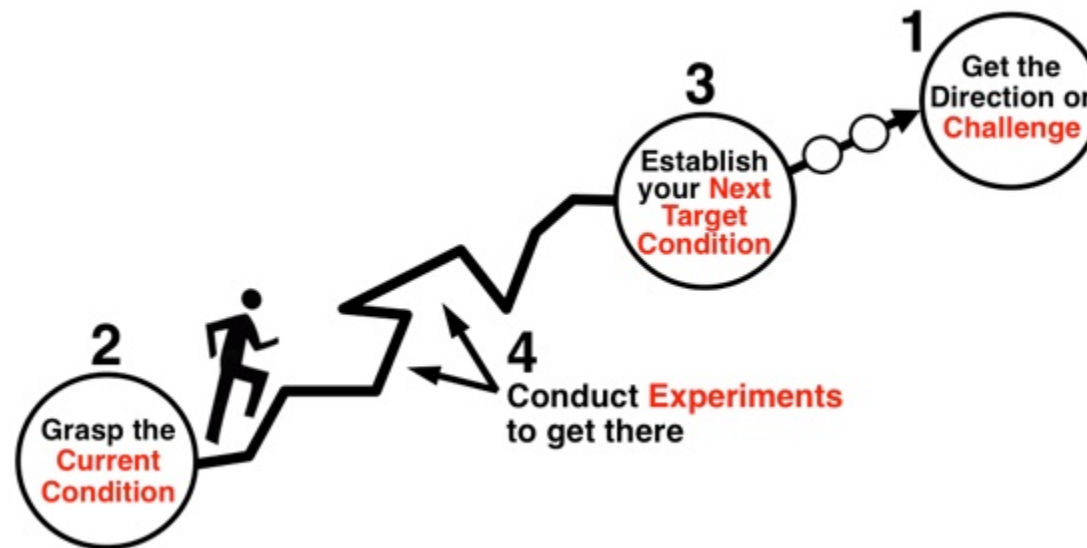

Step 3: Plan an updated value stream

Step 4: Small, incremental experiments
